REST Project Assignment

 Define a new Web Project REST-UserApp-Service.

Add a class User with private properties as id,name,password,address,email and corresponding setter and getter methods.

Add class UserService supporting Post and get methods for adding and reading the users.

Use @post,@Get and @Formparam and @Queryparam annotations.

Define application class UserApplication to map UserService   class.

Define html pages userReister .html to post user parameters to UserService url

Define html page userLogin.html to submit with Get method to UserService URL and validate the login result by using Query parameters in response.

Add the needed jars and run userLogin.html and userReister .html in the browser from server and verify.
